Infectious Diarrhea

Infectious Diarrheal Diseases

Russell Lewis Associate Professor, Infectious Diseases Department of Molecular Medicine MEP 2491 Infectious Diseases 27

March 2023

Objectives

- Identify the most common causes of infectious diarrhea in adult patients
- Describe how the patient history and clinical presentation of diarrhea may favour viral versus bacterial causes that benefit from antibiotic therapy
- Compare clinical spectrum of disease in resource-rich vs. resource-poor countries

Background

- Diarrheal disease is one of the top ten leading causes of death worldwide
- Diarrheal disease is a particular concern for children younger than five years old in resource-limited settings
- Among adults in resource-rich settings, diarrhea is often a "nuisance disease" in the healthy individual

- Most cases of acute diarrhea in adults are of infectious etiology, and most cases resolve with symptomatic treatment alone
- When clinicians care for adults with diarrhea, two important decision points are:
 - When to perform stool testing
 - Whether to initiate empiric antimicrobial therapy

Definitions

- Diarrhea is defined as the passage of loose or watery stools, typically at least three times in a 24-hour period
- Reflects increased water content of the stool, whether due to impaired water absorption and/or active water secretion by the bowel
 - Acute 14 days or fewer in duration
 - Persistent diarrhea more than 14 but fewer than 30 days in duration
 - Chronic more than 30 days in duration
- Invasive diarrhea, *dysentery* diarrhea with visible blood or mucous
 - Dysentery is commonly associated with fever and abdominal pain

Etiology

- Most cases of acute diarrhea are due to infections and are self-limited.
- Most cases of acute infectious diarrhea are likely viral, as indicated by the observation that stool cultures are positive in only 1.5 to 5.6 percent of cases
- The major causes of acute infectious diarrhea include:
 - Viruses (norovirus, rotavirus, adenoviruses, astrovirus, and others)

(Fang and Patel, 2017; GBD 2016 Diarrhoeal Disease Collaborators, 2018)

- Bacteria (Salmonella, Campylobacter, Shigella, enterotoxigenic Escherichia coli, Clostridioides difficile, and others)
- Protozoa (Cryptosporidium, Giardia, Cyclospora, Entamoeba, and others
- Non-infectious etiologies become more common with longer duration of diarrhea

(Dryden et al., 1996)

Causes of acute infectious diarrhea in adults in resource-rich settings

| | Likely pathogens | Mean incubation period | Classic/com food sources | m 01 ther epi- demiologic clues |
|-----------------|------------------|------------------------|--|--|
| Watery diarrhea | Norovirus | 24 to 48 hours | Shellfish, prepared foods, vegetables, fruit | Outbreaks in: - Restaurants - Health care facilities - Schools and childcare centers - Cruise ships - Military populations |
